

REFLECTION

What Did I Learn?

As someone with zero prior programming knowledge, I had only heard about it and loved how it sounded, and wanted to be part of such a cool innovation. Working on this project after just a few Python classes has really taught me a lot. From learning what inheritance and encapsulation are, to successfully applying them in my project, has been genuinely exciting for me.

While working on this project, I learned so much about Python that I never knew before, especially certain commands and what they mean, and the right way to use them. I found myself falling in love with programming all over again along the way. Learning new things and figuring out how to actually implement them in my work is inspiring and encouraging, it motivates me to never stop learning, because it's fun to learn something and then know how to actually use it.

Challenges Faced

I know some people might not believe this if I told them, but my biggest challenge in this project was indentation. I faced so many issues with this particular part that I nearly gave up. Surprisingly, everything else felt manageable until I reached that stage, I would indent one thing and it would disorganize another. I sat there looking at my code full of red lines that I literally almost wanted to cry.

A related problem I encountered was making sure all my methods stayed inside their correct classes, I had real trouble navigating that as well. But after several attempts, I was eventually able to get it right.

How I Intend to Improve It, Given More Time

If I were given more time, I believe it would have helped me go back through all my work, learn more about the errors I encountered, and properly understand how to fix them. That said, I don't intend to stop learning, I've also planned to look for similar assignments to practice on, which will help me become more familiar with everything I've worked on so far.
